Increase Transparency and Access to Usable Data

In an increasingly data-driven world, governments are faced with a growing volume of data that resides in both their active and archived files. They're also challenged with becoming electronic and transparent, allowing for information and records to be made searchable and reportable while remaining compliant with public disclosure regulations.

With current technology, it is expected that information be processed timely and accurately, and that governments transform into an electronic administration. Document management remains at the forefront of this movement, and state, local and federal government agencies alike are in a unique position to capitalize on improved automation that provides new services with these searchable and digital records.

Building Your Digital Database Efficiently and Securely

Quick access to all data has propelled governments to strive towards an e-administration and the building of a global knowledgebase to ensure immediate information retrieval and sharing. However, because of privacy and confidentiality laws, all data cannot become public. With A2iA's unique ability to locate user-defined keywords and phrases anywhere on a page, redaction applications can speed their search and discovery process and declassify, or privatize records, with more speed and efficiency. Manual document handling is reduced and key data becomes quickly accessible.

Forms, deeds, handwritten letters, payments and more – A2iA's data extraction (OCR, ICR and IWR) toolkits automatically locate and extract critical information, while our powerful document sorting and indexing engines route the data throughout the administration. Whether documents are shared interdepartmentally or externally for public use, they can be managed more effectively and more securely with A2iA, helping governments automate even the most complex workflows and facilitate the conversion of paper files to searchable digital documents.

An Unmatched Added-Value

By allowing governments to eliminate manual keying and sorting, costly, manual labor can be cut from the budget and keyers can be deployed elsewhere for increased productivity. An added benefit of employing A2iA's advanced recognition engines is the enhancement of privacy -- third-party interaction is eliminated, an especially critical step for confidential data in the military and defense space. Governments often handle documents with writing in various languages or with different country-specific writing styles and A2iA's software toolkits are available in 24-country versions and 7 languages, for use with all types of writing, including cursive data.
