A2iA Signs New Partnership Agreement with Techlimed,
for Integration of its Unique Arabic Recognition Technology
into their Advanced Search Solutions for Arabic Content Management Product Offering

A2iA & Techlimed will present for the first this combined solution at GITEX from October 12th to 16th in Dubai.
Visit our booths D4-30 and D4-20 on the French Pavilion in Hall 4
to discover our new solutions to manage Arabic content & information.

Paris / Dubai, October 12th, 2014 – Extracting, analysing and conferring meaning to a large selection of digital data has become an important challenge for all. Automatic language processing is one of the best-adapted tools to meet the challenges and opportunities associated with big data. Content analysis in Arabic is crucial for a large number of organisations at the current time. The dramatic increase in data requires tools which are adapted to unprecedented quantities, speed and variety of data, from electronic to paper-based documents.

Rewarded in many international competitions for Arabic handwriting recognition, **A2iA**, **Artificial Intelligence & Image Analysis**, the worldwide leading developer of handwritten and machine printed text recognition, data extraction and document classification of paper-based documents, launched in 2013 the industry's most comprehensive and precise Arabic data recognition software, providing tangible results by automatically locating, extracting, and classifying all types of information, including previously inaccessible data.

Techlimed (www.techlimed.com) is a company specialised in Natural Language Processing (NLP) which combines linguistics, IT and artificial intelligence to design and commercialise solutions which analyse content in Arabic. Techlimed disposes of unique technology capable of industrial processing for the purpose of extraction, indexation and information search in Arabic.

Embedded into Techlimed's advanced search solutions for Arabic content management, the unique Arabic data recognition technology from A2iA will allow all Arabic native language organisations to extract, index and analyse any information in Arabic, from paper to electronic. This combined solution addresses the needs of large data creators and users such as administrations, the media, ISPs, IT solutions providers and large corporations.

"We are seeing a tremendous amount of interest for A2iA Technology for Arabic recognition and are excited to sign this new agreement with Techlimed," said Jean-Louis Fages, A2iA President & Chairman of the Board. "This new partnership reinforces our presence in this new market, proving an innovative solution to meet market demands for Arabic recognition and data management."

" This partnership opens large perspectives for the processing of Arabic content. Major administrations or companies will finally get their content into digital format, which is a great step into a new Arabic digital era" said Ramzi Abbès, founder & CEO of Techlimed. "Thanks to A2iA technology and Techlimed, large data creators and users will have the most efficient tool to manage Arabic paper based documents. A kind of "missing link" has been discovered for Arabic content management."

About A2iA

A2iA, Artificial Intelligence and Image Analysis (www.a2ia.com), is the worldwide leading developer of specialized and highly intelligent software toolkits that help users optimize their data capture, document processing and workflow automation capabilities. Since its inception, A2iA has been a science-driven and research-based software developer and our products feature state-of-the-art and proprietary recognition technologies, including handwriting recognition, intelligent word and optical character recognition, and automatic classification engines, that address our customers' complex data extraction and document processing needs. A2iA's products are critical components that help drive information system accuracy, efficiency and ROI performance. Working closely with our end user customers and our worldwide network of system integrators, A2iA also ensures each solution makes fiscal sense and fits seamlessly within the information technology environment.
